Field of the Invention The present invention relates to a thermal type air flow rate measuring device. More specifically, the invention relates to a thermal type air flow rate measuring device of the type in which the air flow rate is obtained by detecting the difference in temperature of the air sucked by the thermal type air flow rate measuring device. 2. Description of the Prior Art A thermal type air flow rate measuring device is a device for measuring the air flow rate by measuring the difference in temperature of the sucked air. As is well known, in such a thermal type air flow rate measuring device, the temperature of the air is elevated to a relatively high temperature when the air is sucked, and the difference in temperature between the sucked air and the air flowing around it is detected. On the other hand, as is also well known, in such a thermal type air flow rate measuring device, when the air flow rate is small, there is a danger of the device being affected by heat loss. In view of this, in the thermal type air flow rate measuring device of the type under discussion, a heater for heating the sucked air is provided. In this manner, even when the temperature of the air sucked by the thermal type air flow rate measuring device is low, the air is heated by the heater, and the difference in temperature between the air sucked by the thermal type air flow rate measuring device and the surrounding air is increased. As a result, even when the air flow rate is small, the difference in temperature between the air sucked by the thermal type air flow rate measuring device and the surrounding air is detected, so that the air flow rate is detected with accuracy. FIG. 7 shows a schematic diagram of a thermal type air flow rate measuring device which has been provided with a conventional heater. In this figure, reference numeral 2 indicates a plenum chamber, and reference numeral 4 indicates an intake port. A fan 6 is provided in the plenum chamber 2. The intake port 4 is opened and closed by a valve 8. The valve 8 is controlled by a microcomputer 14 through a control circuit 16. In the figure, the reference numeral 10 indicates a fan motor, and the reference numeral 12 indicates a filter. In the thermal type air flow rate measuring device having the above-described 82157476af
